

My algorithm on Search Engine:

1. Split keywords. ("First keyword" and "Second keyword"
2. Open Table "first keyword", and let cursor on first record.
3. Open Table "second keyword" and let cursor on first record;
4. Take value from both of them
5. Compare values from first record at First keyword and first record at second keyword.
6. If value on First keyword at table first keyword **same as** first record on table Second keyword.
7. Take the Values and write the result.
8. Compare values from first record at First keyword and first record at second keyword.
9. If value from first record at table first keyword **bigger** than First record on table second keyword. Then move cursor to next record on table second record.
10. Else, move cursor to next record on table first keyword.
11. Repeat until last record on both of.
